

Maintenance sheet for products made of natural wood

To maintain full useful properties of the product, its regular maintenance is required, including:

- **Surface cleaning:** 2–3 times a year, wipe the surface with soft, slightly wet cloth. Then treat it with an appropriate care product for wood. Do not use alkaline agents or solvents.
- We recommend impregnation no later than within first two years.
- **Impregnate example:** A kit for wood door maintenance from Remmers
- **Protection of external doors:** to minimise the effect of exposure to rain, snow, and intense sunlight, the door should be protected by a recess or a canopy. The canopy should extend outside the outline of the open door and ensure it is kept in the shadow at noon, especially in the summer.
- **Installation:** install the door after masonry works are completed and plasters are dry, on the finished flooring in wall openings.
- **Distance to sources of heat:** a minimum distance between a radiator and a door should be 150 cm.

The above recommendations will help to maintain aesthetic appearance and functionality of wood for many years.
